# CHANGELOG

Chronos follows [semantic versioning](#). Given a version number `Major.Minor.Patch`, the:

- Major version indicates incompatible API changes,
  - Minor version indicates added functionality in a backwards-compatible manner, and
  - Patch version indicates backwards-compatible bug fixes.
- 

## Version 2.2 (Current)

**Release date:** (Pending)

- New [Custom Recorder](#) component to rewind custom properties without scripting
  - Moved gizmos to a subfolder to avoid conflicts
- 

## Version 2.1

**Release date:** October 15, 2015

- Added optional non-rewindable particle systems without limitations
  - Proper support for `Stop()`, `IsAlive()` and `enableEmission` on rewindable particle systems
  - Inspector warnings when for detectable limitations
  - Removed unnecessary using `UnityEditor`
  - Code style improvements
-

## Version 2.0.6

**Release date:** (Septembre 9, 2015)

- Fixed `Timekeeper.AddClock`
  - Fixed parent clock error
  - Fixed component timelines not being adjusted on start
- 

## Version 2.0.5

**Release date:** August 19, 2015

- Smart addon-detection code for PlayMaker
- Fixed timeline event triggers
- Fixed `unscaledDeltaTime` to mimic `deltaTime` behaviour
- Fixed area clocks taking transform position as a limitation
- Added a list of limitations on the website

Starting from v.2.0.5, you no longer need to uncheck the PlayMaker folder when importing, even if PlayMaker isn't installed. Chronos should automatically detect if you install it. In case it doesn't, try a manual check via [Assets > Chronos > Check for addons...](#)

---

## Version 2.0.4

**Release date:** (Skipped)

- Fixed Z coordinate loss in 2D
  - Fixed component timelines properties not being updated
  - Fixed transform and rigidbody component timelines when Record Transform is disabled
  - Delegate occurrences are now strongly typed and don't require a cast from `object`
-

## Version 2.0.3

**Release date:** July 22, 2015

- Added TimeInCurrentState to GetTimelineInfo
  - Fixed particle system duration detection
  - Changed behaviour of paused and rewinding rigidbodies to be more permissive
- 

## Version 2.0.2

**Release date:** July 17, 2015

- Fixed a bug where parent clocks would not be found because of random GameObject load ordering
  - Know issue: Added a warning in cases where the animator recorder failed to record any data. See: <http://forum.unity3d.com/threads/341203>
- 

## Version 2.0.1

**Release date:** July 14, 2015

- Fixed prefab GlobalClock bug by reverting to string-based key
- Added GlobalClockAttribute: apply to string fields to display a nice editor popup with global clock names
- Used Ludiq.Controls for complex popup handling
- Added loop-limiter to particle simulation under Timekeeper (temporary performance hotfix)
- PlayMaker is now a subfolder instead of a .unitypackage file. Uncheck it on import if you don't have PlayMaker.

Global Clock references will be reset. We apologize for the inconvenience.

## Version 2.0

**Release date:** June 25, 2015

Note: \* indicates a backwards-incompatible change. See upgrade notes for more details.

## NEW

- Animator rewind support
- State properties and methods on particle systems
- Custom property drawer for global clocks\*
- PlayMaker example scene
- PlayMaker actions for global clocks

## IMPROVEMENTS

- Consolidated component-timeline organization\*
- Shared recording properties for all recorders on timeline\*
- Automatic transform / physics recording without recorders\*
- Component documentation links in inspector

## FIXES

- Fixed bug where time scale of children clocks wasn't updated
- Fixed bug where angular velocities weren't affected by time scale

## UPGRADE NOTES

Chronos 2.0 is a big release packed with new features, a massive restructuring and various bugfixes. While we tried our best to cause as little change to your projects as possible, there are still areas you will need to manually edit when upgrading.

### GLOBAL CLOCKS

All Global Clock property drawers have been reset. You will need to manually relink all your clocks' `Parent` properties, as well as all your timelines' `GlobalClock` property, if they were in global mode.

On the plus side, you can now directly refer to global clocks with a simple `public GlobalClock clock;` in your custom scripts.

### BUILT-IN COMPONENTS

All parts of Chronos where timelines changed properties of built-in Unity components (e.g. animation speed, audio source pitch, etc.) have been reorganized. Instead of using `Timeline.(component)Speed`, you should now use `Timeline.(component).(property)`.

For example, `Timeline.audioSpeed` becomes `Timeline.audioSource.pitch`. For the full list of changes, have a look at the [Migration](#) page.

## PHYSICSTIMER / TRANSFORMRECORDER

PhysicsTimers and TransformRecorders have been merged with the Timeline component. You no longer need to add them to your GameObjects, and all the ones that were there will have missing scripts. You can safely remove the missing script references. Afterwards, check the Timeline and make sure the **Record Transform** property is checked and adjust the recording properties.

---

## Version 1.2

**Release date:** May 12, 2015

- Added example scene
  - Improved time scale cascade stability / readability
  - Locked recorder interval and duration in inspector at runtime
  - Fixed bug when rewinding PhysicsTimers with custom FixedUpdates
  - Fixed bug with time scale cascade
  - Fixed bug where restarting after a rewind lacked precision
  - Fixed bug that editing parent in inspector did not update at runtime
- 

## Version 1.1

**Release date:** May 3, 2015

- Particle System rewind support
  - PlayMaker integration
-

Version 1.0

**Release date:** April 9, 2015

- Initial release
